

Problem 1 Matrix Representation: 15pts

Let $\{|0\rangle, |1\rangle, |2\rangle, |3\rangle\}$ be the standard orthonormal basis in \mathbb{C}^4 . The cyclic shift operator S permutes the basis vectors as follows: $|0\rangle \rightarrow |1\rangle, |1\rangle \rightarrow |3\rangle, |3\rangle \rightarrow |2\rangle, |2\rangle \rightarrow |0\rangle$. Let $|\psi\rangle := \alpha_0|0\rangle + \alpha_1|1\rangle + \alpha_2|2\rangle + \alpha_3|3\rangle$. Please compute the following:

(a) (9 pts) Determine the matrix representation for S^3 and S^\dagger .

$$S = \begin{pmatrix} 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 \end{pmatrix} \rightarrow S_2 = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \rightarrow S_3 = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{pmatrix}.$$

$$S^\dagger = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{pmatrix},$$

(b) (3 pts) Compute $S^2|\psi\rangle$.

$$S^2|\psi\rangle = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \cdot \begin{pmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{pmatrix} = \begin{pmatrix} a_3 \\ a_2 \\ a_1 \\ a_0 \end{pmatrix}$$

(c) (3pts) Compute $\langle\psi|(S|\psi\rangle)$.

$$\langle\psi|(S|\psi\rangle) = \begin{pmatrix} a_0 & a_1 & a_2 & a_3 \end{pmatrix} \cdot \left[\begin{pmatrix} 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 \end{pmatrix} \cdot \begin{pmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{pmatrix} \right]$$

$$\langle\psi|(S|\psi\rangle) = \begin{pmatrix} a_0 & a_1 & a_2 & a_3 \end{pmatrix} \cdot \begin{pmatrix} a_2 \\ a_0 \\ a_3 \\ a_1 \end{pmatrix} = a_0a_2 + a_1a_0 + a_2a_3 + a_3a_1$$

Problem 2 Superdense Coding: 5pts

As learned from class we know that Alice can send two bits of message to Bob by using only one qubit, provided that the qubit she manipulates is already entangled with Bob. All Bob has to do is measure in the bell basis. In the lecture note, we have the state $|\psi_{11}\rangle = \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle)$ left un-verified. Please show that when Bob measure $|\psi_{11}\rangle$ in the bell basis, the system will collapse to $|11\rangle$.

$$\begin{aligned}
 |\psi_{11}\rangle &= \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle) \\
 &\xrightarrow{CNOT \text{ gives}} \frac{1}{\sqrt{2}}(|01\rangle - |11\rangle) \\
 &\xrightarrow{H \text{ gives}} \frac{1}{2}[(|0\rangle + |1\rangle)|1\rangle - (|0\rangle - |1\rangle)|1\rangle] = \\
 &\quad \frac{1}{2}[|01\rangle + |11\rangle - |01\rangle + |11\rangle] = \\
 &\quad |11\rangle
 \end{aligned}$$

Problem 3 Hadamard in the Deutsch-Jozsa Algorithm: 5+10pts

Let X, Y be two n -bit strings that $X = x_1x_2\dots x_n$ and $Y = y_1y_2\dots y_n$ where $x_i, y_i \in \{0, 1\}$. Please prove the following:

(a) When $n = 2$, show that $H^{\otimes 2}|X\rangle = \sum_{Y \in \{0,1\}^2} (-1)^{X \cdot Y} |Y\rangle$ where $X \cdot Y = x_1y_1 + x_2y_2$

$$\begin{aligned}
 H^{\otimes 2}|X\rangle &= H|x_1\rangle \otimes H|x_2\rangle = \left[\frac{1}{\sqrt{2}} \sum_{y_1 \in \{0,1\}} (-1)^{x_1 \cdot y_1} |y_1\rangle \right] \otimes \left[\frac{1}{\sqrt{2}} \sum_{y_2 \in \{0,1\}} (-1)^{x_2 \cdot y_2} |y_2\rangle \right] \\
 H^{\otimes 2}|X\rangle &= \left[\frac{1}{2} \sum_{Y \in \{0,1\}^2} (-1)^{X \cdot Y} |Y\rangle \right]
 \end{aligned}$$

(b) $H^{\otimes n}|X\rangle = \sum_{Y \in \{0,1\}^n} (-1)^{X \cdot Y} |Y\rangle$ where $X \cdot Y = \sum_{i=1}^n x_i y_i$

$$\begin{aligned}
 H^{\otimes n}|X\rangle &= H|x_1\rangle \otimes \dots \otimes H|x_n\rangle = \left[\frac{1}{\sqrt{2}} \sum_{y_1 \in \{0,1\}} (-1)^{x_1 \cdot y_1} |y_1\rangle \right] \otimes \dots \otimes \left[\frac{1}{\sqrt{2}} \sum_{y_n \in \{0,1\}} (-1)^{x_n \cdot y_n} |y_n\rangle \right] \\
 H^{\otimes n}|X\rangle &= \left[\frac{1}{2^n} \sum_{Y \in \{0,1\}^n} (-1)^{X \cdot Y} |Y\rangle \right]
 \end{aligned}$$

Problem 4 Blochsphere: 10+15pts

Let $|\psi\rangle = e^{i\gamma} \cos(\frac{\theta}{2})|0\rangle + e^{i(\gamma+\varphi)} \sin(\frac{\theta}{2})|1\rangle$ and $|\tilde{\psi}\rangle = \cos(\frac{\theta}{2})|0\rangle + e^{i\varphi} \sin(\frac{\theta}{2})|1\rangle$.

(a) Please explain why global phase $e^{i\gamma}$ is irrelevant in the eye of measurement.

The global phase $e^{i\gamma}$ is irrelevant, because when quantum bits are actually measured, they collapse to a specific state, and since $e^{i\gamma}$ is evenly distributed between the two basis vectors, it has no large scale impact on the outcome favoring $|0\rangle$ or $|1\rangle$.

(b) Please show that $e^{iAx} = \cos(x)\mathbb{I} + i\sin(x)A$ where A is a square matrix that $A^2 = \mathbb{I}$ and $x \in \mathbb{R}$.

$$\begin{aligned} e^{iAx} &= \cos(x)\mathbb{I} + i\sin(x)A \\ e^{iAx} &= \cos(x)AA + i\sin(x)A \\ \text{Let } Ai = T, \quad e^{Tx} &= \cos(x) + T\sin(x) \end{aligned}$$

Euler's Formula states $e^{ix} = \cos x + i\sin x$.

The power series expansion of

$$e^{ix} = 1 + x - \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} - \frac{x^6}{6!} - \frac{x^7}{7!} + \dots = \sum_{n=0}^{\infty} \frac{(ix)^n}{n!}$$

The power series expansion of $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!}$

The power series expansion of $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!}$

Similarly, since $A^2 = \mathbb{I}$, the power series expansion is now

$$e^{Tx} = 1 + Tx + \frac{(Tx)^2}{2!} + \frac{(Tx)^3}{3!} + \frac{(Tx)^4}{4!} + \frac{(Tx)^5}{5!} + \frac{(Tx)^6}{6!} + \frac{(Tx)^7}{7!} + \dots = \sum_{n=0}^{\infty} \frac{(Tx)^n}{n!},$$

or rather

$$e^{iAx} = 1 + Ax - \frac{\mathbb{I}x^2}{2!} - \frac{(Ax)^3}{3!} + \frac{\mathbb{I}x^4}{4!} + \frac{(Ax)^5}{5!} - \frac{\mathbb{I}x^6}{6!} - \frac{(Ax)^7}{7!} + \dots = \cos(x)\mathbb{I} + i\sin(x)A$$

.

Problem 5 Deutsch Algorithm: 20pts

In the Deutsch algorithm, when we consider U_f as a single-qubit operator $\hat{U}_{f(x)}$, $\frac{|0\rangle - |1\rangle}{\sqrt{2}}$ is an eigenstate of $\hat{U}_{f(x)}$, whose associated eigenvalue gives us the answer to the Deutsch problem. Suppose we did not prepare $\frac{|0\rangle - |1\rangle}{\sqrt{2}}$ but $|0\rangle$ instead in the target qubit and we just run the same circuit on that configuration. Please compute and explain what happens at the end of measurement. Furthermore, please conclude the probability that we get the right answer.

$$|\psi_0\rangle = |0\rangle \otimes |0\rangle$$

$$|\psi_1\rangle = \frac{|0\rangle - |1\rangle}{\sqrt{2}} \otimes |0\rangle = \left[\frac{|0\rangle}{\sqrt{2}} \otimes |0\rangle \right] - \left[\frac{|1\rangle}{\sqrt{2}} \otimes |0\rangle \right] = \frac{|00\rangle - |10\rangle}{\sqrt{2}}$$

$$|\psi_2\rangle = \frac{(-1)^{f(0)}|0\rangle - (-1)^{f(1)}|1\rangle}{\sqrt{2}} \otimes |0\rangle$$

$$|\psi_3\rangle = ((-1)^{f(0)}[f(1) \oplus f(0)]) \otimes |0\rangle$$

$$1. f(0) = 0; f(1) = 0 : (-1)^0 |0 \oplus 0\rangle \otimes |0\rangle = |0\rangle \otimes |0\rangle = |00\rangle = \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

$$2. f(0) = 0; f(1) = 1 : (-1)^0 |1 \oplus 0\rangle \otimes |0\rangle = |1\rangle \otimes |0\rangle = |10\rangle = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 0 \end{pmatrix}$$

$$3. f(0) = 1; f(1) = 0 : (-1)^1 |0 \oplus 1\rangle \otimes |0\rangle = (-1)^1 |1\rangle \otimes |0\rangle = (-1)^1 |10\rangle = \begin{pmatrix} 0 \\ 0 \\ -1 \\ 0 \end{pmatrix}$$

$$4. f(0) = 1; f(1) = 1 : (-1)^1 |1 \oplus 1\rangle \otimes |0\rangle = (-1)^1 |0\rangle \otimes |0\rangle = (-1)^1 |00\rangle = \begin{pmatrix} -1 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

As seen above, we know for certain that we get the right answer out half of the time. There are only two different outputs; opposite phases of each other. $\pm|01\rangle$ and $\pm|11\rangle$ never appear in this setup.

Problem 6 Single Qubit Unitary: 10+10pts

We know that when U is a 1-qubit unitary gate, then there exists real numbers α, β, γ and δ such that

$$U = e^{i\alpha} R_z(\beta) R_y(\gamma) R_z(\delta)$$

(a) Please show that $X R_y(\theta) X = R_y(-\theta)$ and $X R_z(\theta) X = R_z(-\theta)$. Recall that $R_z(\theta) = e^{\frac{-i\theta Z}{2}}$ and $R_y(\theta) = e^{\frac{-i\theta Y}{2}}$, $R_x(\theta) = e^{\frac{-i\theta X}{2}}$ where X, Y, Z are the Pauli matrices.

def R(v, M):

 R = exp(-1*sqrt(-1)*v*M/2)

return R

theta = var("Theta")

X = matrix([[0, 1], [1, 0]])

Y = matrix([[0, sqrt(-1)], [-1*sqrt(-1), 0]])

Z = matrix([[1, 0], [0, -1]])

Rx = R(theta, X)

Ry = R(theta, Y)

Rz = R(theta, Z)

Rxn = R(-1*theta, X)

Ryn = R(-1*theta, Y)

Rzn = R(-1*theta, Z)

show("\$R_y\$", theta, "\$")_=_"\$", Ry)

show("\$X*R_y\$", theta, "\$")*_X_=_"\$", X*Ry*X)

show("\$R_y\$", -1*theta, "\$")_=_"\$", Ryn)

show("\$X*R_y\$", -1*theta, "\$")*_X_=_"\$", X*Ryn*X)

$$R_y(\Theta) = \begin{pmatrix} \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} & -\frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} \\ \frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} \end{pmatrix}$$

$$X * R_y(\Theta) * X = \begin{pmatrix} \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} \\ -\frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} \end{pmatrix}$$

$$R_y(-\Theta) = \begin{pmatrix} \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} \\ -\frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} \end{pmatrix}$$

$$X * R_y(-\Theta) * X = \begin{pmatrix} \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} & -\frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} \\ \frac{1}{2}(ie^{i\Theta} - i)e^{(-\frac{1}{2}i\Theta)} & \frac{1}{2}(e^{i\Theta} + 1)e^{(-\frac{1}{2}i\Theta)} \end{pmatrix}$$

(b) Please show that we can rewrite the decomposition of the unitary U in this form

$$U = e^{i\alpha} A X B X C$$

where A, B, C are unitary operators satisfying $ABC = \mathbb{I}$ and the Pauli gate X is the NOT gate.

$$\text{Let } A = R_z(\beta) R_y\left(\frac{\gamma}{2}\right)$$

$$B = R_y\left(\frac{-\gamma}{2}\right) R_z\left(\frac{-(\gamma+\beta)}{2}\right)$$

$$C = R_z\left(\frac{\gamma-\beta}{2}\right)$$

We can rewrite A and B as follows:

$$A_1 = R_z(\beta)$$

$$A_2 = R_y\left(\frac{\gamma}{2}\right)$$

$$B_1 = R_y\left(\frac{-\gamma}{2}\right)$$

$$B_2 = R_z\left(\frac{-(\gamma+\beta)}{2}\right)$$

Then we have,

$$U = e^{i\alpha} A X B X C,$$

$$\text{and } U = e^{i\alpha} A_1 A_2 X B_1 B_2 X C.$$

Since $XX = \mathbb{I}$, as shown earlier, we can just insert XX between B_1 and B_2 .

$$\text{and } U = e^{i\alpha} A_1 A_2 X B_1 X X B_2 X C.$$

And then if we substitute in our values we have,

$$U = e^{i\alpha} R_z(\beta) R_y\left(\frac{\gamma}{2}\right) X R_y\left(\frac{-\gamma}{2}\right) X X R_z\left(\frac{-(\delta+\beta)}{2}\right) X R_z\left(\frac{\delta-\beta}{2}\right)$$

$$U = e^{i\alpha} R_z(\beta) R_y\left(\frac{\gamma}{2}\right) R_y\left(\frac{\gamma}{2}\right) R_z\left(\frac{\delta+\beta}{2}\right) R_z\left(\frac{\delta-\beta}{2}\right),$$

$$U = e^{i\alpha} R_z(\beta) R_y\left(\frac{\gamma}{2}\right) R_y\left(\frac{\gamma}{2}\right) R_z\left(\frac{\delta}{2}\right) R_z\left(\frac{\beta}{2}\right) R_z\left(\frac{\delta}{2}\right) R_z\left(\frac{-\beta}{2}\right),$$

$$U = e^{i\alpha} R_z(\beta) R_y\left(\frac{\gamma}{2}\right) R_y\left(\frac{\gamma}{2}\right) R_z\left(\frac{\delta}{2}\right) R_z\left(\frac{\delta}{2}\right) R_z\left(\frac{\beta}{2}\right) R_z\left(\frac{-\beta}{2}\right),$$

$$U = e^{i\alpha} R_z(\beta) R_y(\gamma) R_z(\delta).$$
